THOUGHTS ON GENDER, FEAR, AND COVID19

During a pandemic, understanding the female fear response is really helpful. Because sometimes, as women, our behaviors make us feel crazy. Even if we intellectually know that it's okay to be in a heightened state of anxiety, the standard theory of fight and flight doesn't quite explain the intensity of our emotions as we fold the laundry, wash the dishes, plan another meal, and then do it all again. And again ~while keeping things sterile for our families.

Adapted to patriarchy, most women are fairly used to feeling afraid. We're braced for this. In normal time, we are guarded and ready for someone to break into our home, grope us on a bus, or follow us into a parking garage. We grow up learning that we are sexual prey. These lessons require us to fold into ourselves, or puff up big and wide. Automatically.

Female bodies are adapted to danger. We live on guard and build symbolic cages to protect ourselves from harm. Tethered to our secure zone, we hide from life and miss out on things we'd like to do. Sometimes, we feel trapped by responsibilities we didn't choose, and our resentment leaks out onto people we love. We escape constant fear with addictive security blankets like wine and Netflix. And these reactions happen without the threat of a deadly virus! For now, these adaptations are intensified.

Men don't understand this type of constant fear. Understandably. Men don't generally experience fear when they get into an elevator alone and find a woman there.

KELLY MCDANIEL

According to Dr. Shelly Taylor, women respond differently to danger than men do. In her groundbreaking work, now widely known as the *tend and befriend* theory, Taylor found that women demonstrate affiliative, pro-social behavior in response to a threat. In response to stress, women *tend* (groom, feed, stroke, clean) and *befriend* (gather, connect). While women can “fight and flight” just as much as men do, Taylor found that we just don’t do it as often. Perhaps this is because fighting or fleeing are less advantageous for females who have babies and children depending on them. Historically, women are more at risk than males in terms of injury or dislocation when someone or something is dangerous.

In an earlier study, a group of men and women were informed that they would experience an electric shock. In the course of the experiment, women chose to wait for the shock with other participants while the men dispersed and waited alone. (Stanley Schachter, 1959). A later study conducted by Robert Jones, professor of psychology and neuroscience at the University of Texas at Austin, found as cortisol increases (when we’re stressed), men withdraw affection from their dogs, while women do exactly the opposite. The women “tended” (pet, brushed, stroked) their dogs when they felt stressed.

Tend and befriend theory makes sense when we think how women have better chances of survival when we stick together. So do our children. Tending and befriending are built in for survival of our species. They are amazing skills. Right now, when families need food and homes require regular sterilization, these skills are essential. Unfortunately, if unappreciated and unrecognized, they are a set up for physical and emotional depletion. And anger. So when a partner dismisses our bid for connection, or minimizes the anxiety we feel, we want to scream, and probably do.

KELLY MCDANIEL

Right now, while we wait to see what will happen to our jobs, our health, and our loved ones, understanding our primitive reactions to fear could perhaps help us feel a bit less crazy. Maybe even a moment of relief. We are simply doing what we're wired to do ~ feed, protect, and stay close to our tribe. We are in overdrive. We are warriors. Understandably, we might irritate the men around us, whether partners, sons, or fathers. Even if we are in same sex partnership, the person more anxiously attached may feel dismissed by her more avoidant partner. These differences don't make us wrong. One set of skills is not better than the other, but in quarantine, those who fight or flee have nowhere to go, and fighting doesn't help. Therefore, men or women with an avoidant attachment style may be more dismissive and defensive than usual. Conflict is inevitable. And most of us have no idea why.

So, my dear readers, to soothe your loneliness, sadness and anger, reach out to other women when you can. "Befriend" with like-minded sisters. Understand that for many of us, the differences in our fear response is making things hot and miserable. This is normal. The emotional distance between you and your partner in ONE space creates a pressure cooker. There are no easy solutions here. We can try breathing, meditating, exercising, watching TV (so many great suggestions coming our way right now on social media) but it might be helpful just to know that nothing is wrong with your reactions. For the time being, this is just the new normal.
